

Trends Within US Census Data Regarding the Relationship between Child Poverty, Poverty, Unemployment and Income by State.

Using 2015 US census data as the source for the dashboard and additional visualizations, it is shown that the states with the most poverty on average are concentrated in the southern states. Here in the dashboard, [link to dashboard](https://public.tableau.com/app/profile/phil.kim/viz/CensusDashboard_17363647632520/Dashboard1?publish=yes)

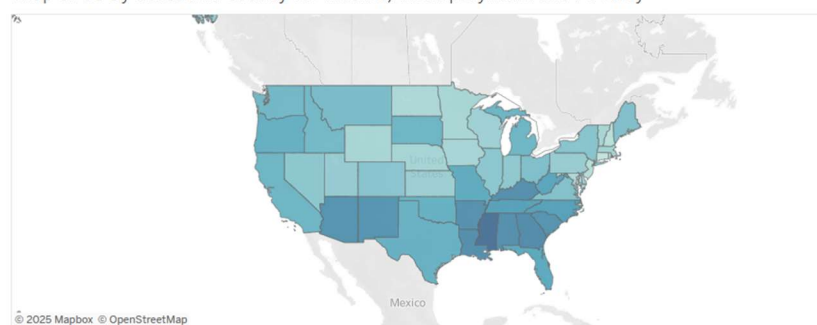

https://public.tableau.com/app/profile/phil.kim/viz/CensusDashboard_17363647632520/Dashboard1?publish=yes, we can see this trend as well as the negative correlation between average income and average poverty. Also, we see that average income and average unemployment have a positive correlation. The scatterplots show a negative sloping trendline for average income vs. average poverty and a positive sloping trendline for average income vs. unemployment. The District of Columbia and Puerto Rico have been removed from the map and bar charts because they are not actual states as well as outliers in the dataset. A scatterplot was chosen to better show the positive and negative trends of the data, while a map was chosen to better show geographical trends. Shades of blue was chosen because of its ease on the eyes and to avoid colors like red and green, which may not be visible to color blind individuals. An image of the dashboard can be seen below.

Trends of Avg Income and Avg Unemployment vs. Avg Poverty by State

Map of US by State and County for Income, Unemployment and Poverty

Another trend within the 2015 US census data is the inverse relationship between average child poverty and average overall poverty vs. average income by state. Here in the bar chart, link to chart https://public.tableau.com/app/profile/phil.kim/viz/BarChart_17363688653180/Sheet4?publish=yes , we can see a general trend where average child poverty and average overall poverty increases as average income decreases. A bar chart was chosen to better illustrate the magnitude of each value for each state. Again, blue was chosen due to the ease on the eyes and to avoid colors such as red and green. Also, the District of Columbia and Puerto Rico were not included due to them not being a state as well as an outlier in the dataset. An image of the chart below.

Here we can see the map of the US by state, link to map https://public.tableau.com/app/profile/phil.kim/viz/Map_17363689273210/Sheet5?publish=yes, where the average child poverty is concentrated in the southern states. Here a map was chosen to better show geographical trends. Again, shades of blue was chosen due to the ease on the eyes and to avoid colors like red and green. Also, the District of Columbia and Puerto Rico were not included due to them not being a state and an outlier in the dataset. An image of the map below.

Map of US by State for Avg Child Poverty and Avg Income
